b) 
$$E = \frac{1}{2} \cdot 10^{-(9-1)} = \frac{1}{2000}$$

c) i. 
$$x_1 \otimes x_2 = 0.7612 \cdot 10^2$$
  
 $x_1 \otimes x_2 = 0.1000 \cdot 10^{-1}$ 

$$\frac{0.01046 - 0.01}{\Delta} = 46$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 1 & 0.25 & 0.25^2 & 0.25^3 & 0.25^4 \\ 1 & 0.5 & 0.5^2 & 0.5^2 & 0.5^4 \\ 1 & 0.75 & 0.75^2 & 0.75^3 & 0.75^4 \\ 1 & 1 & 1 & 1 & 1 \end{bmatrix}$$

A) False (A singular matrix has an LU factorization if and only if all leading nonprincipal submatrices are nonsingular [not covered]).

True. False.

B) [Not covered]

Spectrum 1: B. Tbh I have no idea

Spectrum 2: A. See reasoning above

Spectrum 3: C. Idk the data sequence graph is rounder

Spectrum 4: None

6. a) 
$$W^{N/2} = e^{\frac{i 2\pi}{N} \frac{N}{2}} = e^{i\pi} = -1$$

b) 
$$W^{N-K} = e^{2\pi i (N+1)/N} = e^{2\pi i - 2\pi i k/N} = W^{-K}$$
 for  $1 \le k \le N-1$ 

$$F_{N-k} = \sum_{n=0}^{N-1} f_n W^{-(N-k)n} = \sum_{n=0}^{N-1} f_n W^{(N-k)n} = \sum_{n=0}^{N-1} f_n W^{-nk} = F_k$$

**C**) 
$$C = 1/2$$

There are N multiplications in each summation. There are N/2 even coefficients.

Since 
$$F_N - k = \overline{F_k}$$
, we can compute the first half of the Fourier coefficients, then just take the conjugate of them to get the second half. Then we get C = 1/4.

8. a) Let 
$$Y_1 = y(t)$$

$$\chi^{2}(1) = 1 - (\chi^{2}(1) + y^{2}(1))$$

$$Y_{1}' = 2(Y_{1} - x(1))$$

$$y_2' = 2(y_1 - x(1))$$

$$\begin{bmatrix} \chi'(t) \\ \gamma'_1 \\ \gamma'_2 \end{bmatrix} = \begin{bmatrix} 1 - (\chi^2(t) - y(t)) \\ \gamma_2 \\ 2(\gamma_1 - \chi(t)) \end{bmatrix}$$

- ?? if y(t) > 2 return 1 else -1
- (Not covered)

9. a) 
$$y_1 = y_0 + hf(t_0, y_0)$$
  
= 1.5 + 0.2(2.1 - 1.5)  
= 1.6  
 $y_2 = 1.6 + 0.2(2.1.2 - 1.6)$   
= 1.76

[I have no idea what A and B are but here's what our notes say for adaptive time stepping] If the error is greater than the tolerance, we halve  $h_k$  for the next step. If it is too small, we double  $h_k$  for the next step.
